Pioderma gangrenoso: Atualização e orientação

Quadro 5. Instrumento diagnóstico da forma clássica ulcerada de pioderma gangrenoso (PG)*.

Critério maior

Biopsia de borda de úlcera mostrando infiltrado neutrofílico

Critérios menores

Histologia

Exclusão de infecção (colorações especiais e culturas de tecido)

História

Patergia (ocorrência de úlceras em locais de trauma)

História pessoal de doença inflamatória intestinal ou artrite inflamatória História de pápula, pústula ou vesícula com evolução rápida para ulceração

Exame físico (ou registro fotográfico)

Eritema periférico, borda descolada, hipersensibilidade no local de ulceração Múltiplas úlceras (ao menos uma em região anterior da perna)

Cicatriz cribriforme ou “em papel amassado” após resolução das úlceras

Tratamento

Redução na dimensão da úlcera após um mês de tratamento imunossupressor

Diagnóstico de PG = critério maior + 4 critérios menores

* Proposto por consenso com o método Delphi (Maverakis et al.²⁹).

MOTIVOS DA APRESENTAÇÃO

- **RELATAR CASO EXTENSO E INCAPACITANTE DE PIODERMA GANGRENOSO IDIOPÁTICO REFRATÁRIO ÀS TERAPIAS CONVENCIONAIS**
- **DESTACAR A EXCELENTE RESPOSTA AO USO COMBINADO DE ADALIMUMABE (HUMIRA®) E DAPSONA**

AGRADECIMENTOS
